

Asilidae Target Taxa

We provide here a list of target taxa of species that we deem to be important for phylogenetic analyses dealing with Asilidae.

Most of the target taxa will be available for morphological work through museum collections, but we think it is important to make an effort now to collect these species also for molecular studies for future projects. That's why we encourage members of the Diptera research-community to collect these species.

What do we mean by target taxa?

- We think that if a genus is a major part of the fauna of a particular zoogeographical Region it should be included in phylogenetic studies of the entire Asilidae or subtaxa of it.
- Other genera that have a very widespread distribution and are exceptionally speciose, e.g. *Promachus* Loew, 1848 or *Leptogaster* Meigen, 1803 (to name only two), should be included as well to understand the radiations of these genera and their relationship to other, not so speciose sister taxa.
- Yet other genera are included because of peculiar morphological characters or because they are the only representative of a subfamily taxon in a particular zoogeographical Region.
- All genera that are type genera for family-group taxa, e.g. subfamily taxa, tribal taxa, or other subordinate taxa, should also be included in cladistic studies (these species are marked with an asterisk following the generic name).

Generic classification follows Dikow 2009. **Generic names and tribal taxa in red have not been studied by Dikow (2009) and need to be addressed in future studies. The genera have been retained in either Dasyopogoninae or Stenopogoninae according to the generic catalogue by Geller-Grimm 2004.**

Colour Coding for List of Target Taxa

	important but still not collected
	important & already available
	alternative representative from different zoogeographical Region of needed genus (but not yet collected)
	alternative already available or available without necessity

Abbreviations used

T	=	type species occurs in this zoogeographical Region
X	=	representatives occur in this zoogeographical Region
Q	=	questionable distribution in zoogeographical Region
Nea	=	Nearctic Region
Neo	=	Neotropical Region
Chi	=	Chilean Region (here recognised separately because robber-fly fauna distinct from Neotropical surroundings)
Pal	=	Palearctic Region
Afr	=	Afrotropical Region
Ori	=	Oriental Region
Aus	=	Australasian Region
